Pause Bell’s 300 MW AI Data Centre

Regina–Wascana NDP — CIA Money. MAGA Investors. Our Grid, Our Choice.

This package contains organizing assets for the community campaign to pause Bell Canada’s proposed 300 MW AI data centre campus in the RM of Sherwood, outside Regina, Saskatchewan (Treaty 4 territory). Prepared by Barrett Soron for Regina–Wascana NDP, April 2026.

Contents: petition print sheet · canvasser guide · fact sheet · tenant explainer (CoreWeave & Cerebras) · Bell AI Fabric page rebuttal · social copy · chapter email · Indigenous consultation questions

Canvasser Guide: Data Centre Petition

CIA Money. MAGA Investors. Our Grid, Our Choice.

Regina–Wascana NDP | For volunteer use
Data and sources reviewed and verified as of April 16, 2026.

The 30-second opener (door or table)

> *"Hi — I'm a volunteer with the Regina–Wascana NDP. We're collecting signatures on a petition about the Bell AI data centre being built just outside Regina. It's a massive facility — 300 megawatts — that could drive up electricity bills for everyone in the province, and it's being built to serve American AI companies. The NDP is calling for a pause on data centre expansion until communities have a real say. Can I tell you more, or would you like to sign?"*

If they seem interested, lead with whichever angle connects: energy bills, jobs, governance, or data sovereignty.

What's being built (if they ask)

Bell Canada is building what it calls Canada's largest AI data centre campus — 300 MW on 160 acres in the RM of Sherwood, just south of the city. The announced investment is $1.7 billion. The anchor tenants are CoreWeave and Cerebras — both American AI companies.

Construction is set to start this spring, with operations expected by the end of 2027. SaskEnergy is building a new high-pressure natural gas pipeline specifically to feed the facility.

The land is owned by **George Gordon First Nation**, which has signed a memorandum of understanding with Bell on Indigenous procurement and workforce development. If someone raises that, acknowledge it honestly — the partnership is real — and pivot to the concerns that apply regardless: electricity rates, who actually uses the compute and under what law, and the absence of independent environmental review.

Why it matters locally (use the angle that lands)

Energy bills: "In Virginia, where data centres have clustered, regulators say residential electricity bills could more than double by 2045 unless data centres pay their fair share — and the state just had to create a special rate class to try to protect households. Saskatchewan's grid is already strained. A 300 MW facility is a huge new load, and SaskEnergy is building a new gas pipeline just to serve it. Who do you think pays when the grid gets more expensive to run?"

Jobs: "Bell says 800 temporary construction jobs and 80 permanent ones. Eighty. For a facility that could reshape the province's energy future. That's not an economic development plan — that's a server farm."

Process: "A $1.7-billion project that reshapes the province's grid is moving ahead without an independent environmental assessment and without meaningful public consultation. That's not how decisions of this scale should be made. A pause gives our democratic institutions time to catch up."

Data sovereignty: "The anchor tenants are American AI companies — CoreWeave and Cerebras. Under US law — the CLOUD Act — American authorities can compel access to data stored by US companies, even when it's physically in Canada. This isn't theoretical. When the ICC prosecutor issued an arrest warrant for Netanyahu, Trump sanctioned him and Microsoft cut off his email. Microsoft France later admitted under oath to the French Senate that it 'cannot guarantee' it would deny US government requests for data stored in Europe. That's the same legal regime these data centres operate under."

Climate: "Saskatchewan's grid runs on roughly 80–90% fossil fuels — coal and natural gas. A 300 MW data centre on this grid isn't green tech. SaskEnergy is building a new high-pressure gas pipeline just for this facility, and the province has said the baseload requirements justify refurbishing coal plants. Premier Moe has already committed to running coal until 2050. This project isn't neutral on climate — it's a reason to keep the coal burning."

Community impact: "Data centres often target locations with weak governance or oversight. Bell has been short on details and slow to respond to local concerns about noise and light pollution, local water sources, storm drainage, and disturbance to the surrounding area. They recently held a private meeting with concerned landowners who had been formally requesting information for months. There's still nothing on record or binding about the impact to the area — or what can be done if they aren't compliant."

Public infrastructure, private profit: "SaskPower, SaskEnergy, and SaskTel were built by CCF and NDP governments as public goods — Saskatchewan invented the Crown corporation. Bell already charges Canadians some of the highest phone and internet rates in the developed world, and now wants the publicly-built grid and a new publicly-funded gas pipeline to sell cheap compute to American AI firms. That's the public choice at stake: who do our utilities serve?"

Sovereignty framing: "Bell's page brands this as 'Sovereign AI infrastructure — built by Canadians, for Canada.' But Bell is the landlord. The tenants — CoreWeave and Cerebras — are American AI companies operating under US law. Under the CLOUD Act, the jurisdiction running these servers is American. A Canadian postal address doesn't make Canadian-controlled infrastructure."

Who are the tenants?

It's worth knowing who Bell is building this for.

CoreWeave started as a cryptocurrency mining company called Atlantic Crypto, founded in 2017 by three hedge fund traders. They pivoted to renting AI server capacity when the money shifted. They went public in early 2025 at a reduced price; the company is deeply unprofitable and carrying roughly $7.5 billion in debt. Major backers include Magnetar Capital — the hedge fund that famously profited from the 2008 financial crisis. About 1,000 employees manage billions in infrastructure. No published policy excluding surveillance or military AI applications from their platform.

Cerebras is an AI chip company with active, multi-phase contracts with **DARPA** — the US military's research agency — including building real-time battlefield simulation and electronic warfare systems for the US Navy. The CIA's venture capital arm, **In-Q-Tel**, is an investor. So is **1789 Capital**, the anti-ESG fund co-founded by Rebekah Mercer (major Trump donor) and linked to Peter Thiel — an explicitly "America First" fund. Cerebras's largest customer, accounting for 87% of its revenue in the first half of 2024, was G42, a UAE AI conglomerate flagged by the US Congress for ties to Chinese military and human rights abuses. Cerebras postponed its 2024 IPO after CFIUS — the US national-security review board — opened an investigation into G42's ownership

stake, and withdrew the filing in October 2025. It is now refiling for a 2026 listing with G42 reportedly no longer an investor.

These are the companies Saskatchewan is being asked to build public infrastructure for.

What the NDP is calling for

NDP Leader Avi Lewis has committed to a **Humans-First AI Policy** that includes **pausing the expansion of AI data centres in Canada** — to protect clean water, preserve energy for human health and wellbeing, and give democratic institutions time to catch up to a technology that's been deployed without public debate.

Specific federal levers include:

- Amending the Canadian Environmental Protection Act to regulate data centre impacts
- Withdrawing federal dollars that fund data centre projects
- Levying a tax on data centres
- Or a combination of all of the above

This isn't anti-technology. It's a call for technology that serves people, not the other way around.

Common objections

"It's $1.7 billion in investment — that's good for Saskatchewan."

> *"The investment number sounds big, but follow the money. Most of it goes to construction (temporary) and equipment (manufactured elsewhere). Eighty permanent jobs. The energy costs and infrastructure burden stay with us permanently. Investment is only good if the community actually benefits."*

"We need the jobs."

> *"Eighty permanent jobs. Compare that to what the same public investment could create in housing, health care, or renewable energy — sectors that employ people locally, at scale, permanently. This isn't a jobs plan."*

"Data centres are the future — you can't stop progress."

> *"Nobody's saying stop all technology. The NDP supports useful applications of machine learning — things like medical research and solar tracking. What we're questioning is whether a 300 MW facility serving American AI corporations should jump the queue ahead of affordable energy, clean water, and community consent. A pause isn't a ban. It's a chance for our democratic institutions to catch up."*

"Bell says they're using a closed-loop cooling system — no water impact."

> *"That's their claim. But closed-loop systems use air-cooled heat rejection, which requires significantly more electricity than evaporative cooling to move the same heat. On a fossil-fuel grid, that means more emissions. Bell has minimized the water footprint on a grid where water isn't the binding constraint — and pushed the cost onto the grid, where the binding constraint is carbon. And independent experts have raised*

> *questions about what 'closed-loop' actually means at this scale. The point is: we don't have independent assessment yet. That's exactly why there should be a pause."*

"These are big, reputable companies — Bell, CoreWeave, Cerebras."

> *"Bell is the landlord — but the tenants are worth looking at. CoreWeave started as a cryptocurrency mining operation run by hedge fund guys. They're carrying $7.5 billion in debt and went public at a reduced price. Cerebras has active military contracts with DARPA — the US military research agency — building battlefield simulation systems. The CIA's venture fund is an investor. So is an anti-ESG fund linked to Rebekah Mercer and Peter Thiel. These aren't community partners. They're speculative American military-tech firms looking for cheap energy."*

"The provincial government supports it."

> *"The provincial government also plans to run coal plants until 2050 — two decades past the federal phase-out deadline. Provincial support doesn't mean it's in the community's interest. That's what the petition is about: making sure the federal government uses its levers to protect communities, regardless of what the province signs off on."*

"Bell says electricity rates won't go up."

> *"That's exactly what Virginia said. Initially, Virginia officials gave the same assurance. Now regulators project residential bills could more than double by 2045 unless data centres pay their full share of grid costs. Dominion has already been granted rate increases. Virginia had to create a dedicated large-load rate class to try to shield households from further cost exposure — after the data centres were built, not before. The time to protect ratepayers is before the concrete is poured."*

"Isn't this an Indigenous-partnered project? Who is the NDP to object?"

> *"George Gordon First Nation has signed a real partnership with Bell, and the land is GGFN-owned. That's legitimate Indigenous economic participation and we respect it. Our concerns are different: they're about electricity rates for every household in the province, who actually uses the compute and under what legal regime, the grid emissions and new pipelines SaskEnergy is building for this, and the absence of independent environmental review. None of that contradicts the GGFN partnership — it's about federal policy on the data centre industry as a whole, and about the American tenants who'll be leasing the servers."*

The ask

1. **Sign the paper petition** — collect name, address, postal code, email, and phone. All fields help, but don't push if someone hesitates on phone.
2. **Offer to leave a fact sheet** — good for people who want to think about it or share with family.
3. **Note the conversation** — if someone is particularly engaged, enthusiastic, or wants to get involved, flag them for your chapter lead. These are future volunteers.

What to do with signed petitions

- Keep pages flat and dry — don't fold.
- Return to your chapter lead or bring to the next Regina–Wascana NDP event.
- If you collect email addresses, those will be entered into the NDP database by authorized EDA personnel — **do not photograph, screenshot, or store personal data on your personal devices**.

Data custody

The Regina–Wascana NDP electoral district association has custody of all data collected through this petition, governed by the federal NDP Privacy Policy. Personal information is used to contact signatories about NDP activities, shared with riding associations as needed, and never sold. Signatories can opt out at any time by contacting dnc@ndp.ca.

If you have questions about data handling, direct them to your chapter lead.

Notes

- This is a **party** action — Regina–Wascana NDP. Keep branding at the riding association level.
- The petition asks the **federal government** to act — this is relevant federal jurisdiction (environmental regulation, federal funding, trade and commerce).
- This initiative takes place on **Treaty 4 territory**. Acknowledge this respectfully. Do not speak on behalf of First Nations — if someone raises Indigenous consultation concerns, listen, note them, and share with your chapter lead.

Regina–Wascana NDP | April 2026

Bell's AI Data Centre: What Regina Needs to Know

CIA Money. MAGA Investors. Our Grid, Our Choice.

Regina–Wascana NDP
Treaty 4 territory | Data and sources reviewed and verified as of April 16, 2026.

What's being built?

Bell Canada is constructing what it calls Canada's largest purpose-built AI data centre campus — 300 megawatts of capacity on 160 acres in the Rural Municipality of Sherwood, just south of Regina. The announced investment is $1.7 billion, with Bell projecting $12 billion in economic value over time.

The anchor tenants are **CoreWeave** and **Cerebras** — both American artificial intelligence companies. Construction is set to begin spring 2026, with first operations expected by the end of 2027.

The site sits on land held by **George Gordon First Nation**, which has signed a memorandum of understanding with Bell focused on Indigenous procurement and workforce development. The concerns raised in this fact sheet — electricity costs, environmental review, grid emissions, and US data sovereignty — are questions of federal policy on the data centre industry. They apply regardless of the land arrangement, and they're not a comment on GGFN's decision to participate.

Who are CoreWeave and Cerebras?

CoreWeave began as a 2017 cryptocurrency mining operation run by hedge fund traders; it pivoted to renting AI servers, went public in March 2025 at a reduced offering price, and carries roughly $7.5 billion in debt (co-led by Blackstone and Magnetar Capital). **Cerebras** makes AI processors and has active DARPA military contracts, CIA venture funding (via In-Q-Tel), and investors that include Rebekah Mercer's "America First" fund. Cerebras's largest customer in the first half of 2024 was G42, a UAE AI firm flagged by US Congress for ties to Chinese military and human rights abuses; its IPO was postponed under a CFIUS national-security review.

These are the companies Saskatchewan is being asked to reshape its energy grid and public infrastructure for. The *Tenant Explainer* later in this package provides the full backgrounder — investor rosters, contract details, and sources.

What are the concerns?

Energy costs for everyone. A 300 MW facility is an enormous new load on Saskatchewan's grid. In Virginia — where data centres have clustered at industrial scale — regulators project residential electricity bills could more than double by 2045 unless data centres pay their share of grid costs. Dominion has already been granted rate increases, and the state has created a dedicated large-load rate class to try to shield households from further cost exposure. SaskEnergy is building a new high-pressure natural gas pipeline specifically to feed this facility. Infrastructure costs don't stay at the data centre — they get spread across every ratepayer in the province.

Eighty permanent jobs. Bell projects 800 temporary construction jobs and 80 permanent positions. For a facility of this scale, that's minimal local employment. The $12 billion headline masks the fact that most of the economic activity flows to equipment manufacturers and the American AI companies leasing server space — not to Saskatchewan workers and families.

A fossil-fuel anchor. Saskatchewan's grid runs on roughly 80–90% fossil fuels (the mix is currently shifting toward more natural gas and less coal). At 630 g CO_2e per kilowatt-hour, its emission intensity is more than six times the national average of 100 g. A 300 MW data centre on this grid isn't green technology — it's a massive new source of carbon emissions that locks the province into fossil-fuel dependence for decades. And that's not abstract: SaskEnergy is building a new high-pressure gas pipeline and meter station dedicated to Bell's on-site gas generation, and the province has said the data centre's baseload needs justify refurbishing aging coal plants. Premier Moe has already committed to running coal until 2050 — twenty years past the federal phase-out deadline. This project makes that timeline harder to undo.

Governance breakdown. Four of seven RM of Sherwood council members resigned shortly after the data centre was announced. The province then appointed interim replacements — meaning locally-elected oversight was replaced with provincial appointees at the very moment major decisions about the development were still being made.

Canadian data in American hands. Bell's public page brands the project as "Sovereign AI infrastructure — built by Canadians, for Canada." Sovereignty is a marketing word here. CoreWeave and Cerebras are US-incorporated companies. Under American law — including the CLOUD Act — US authorities can compel access to data held by American companies regardless of where the data is physically stored.

This is not theoretical. In 2025, President Trump sanctioned the International Criminal Court's chief prosecutor and Microsoft cut off his email access. When the French Senate asked Microsoft France under oath whether it could guarantee it would deny US government requests for data stored on its servers within the European Union, the company said it "cannot guarantee" that. As journalist Paris Marx has argued, every data centre operated by a US company is effectively an extension of US jurisdiction — what European lawmakers have called a digital "kill switch." The Canada-United States-Mexico Agreement makes this worse: it contains clauses that limit Canada's ability to regulate cross-border data flows or require companies to store Canadian data within our borders.

What about water?

Bell claims the facility will use a closed-loop cooling system that doesn't draw municipal water. That claim is mostly accurate — the air-cooled heat rejection design does not consume water the way evaporatively-cooled facilities do. The trade-off is what Bell doesn't say: air-cooled systems require significantly more *electricity* than evaporative cooling to move the same heat. On a fossil-fuel grid running at 630 g CO_2e per kilowatt-hour, that extra electricity translates directly into extra emissions. Bell has minimized the water footprint on a grid where water isn't the binding constraint, and pushed the cost onto the grid, where the binding constraint is carbon.

Independent experts have raised questions about what "closed-loop" actually means at industrial scale, and no independent environmental assessment has been conducted.

For context: globally, data centre water consumption is projected to rise from 560 billion litres per year to 1,200 billion litres by 2030, according to the International Energy Agency. A single Microsoft data centre in Vaughan, Ontario is expected to consume 730 million litres annually.

What is the NDP calling for?

NDP Leader Avi Lewis has committed to a **Humans-First AI Policy** that includes **pausing the expansion of AI data centres in Canada** — to protect clean water, preserve energy for human health and wellbeing, and give our democratic institutions time to catch up to a technology that has been deployed without any public debate. This is a federal ask because the underlying questions — national security, data sovereignty, cross-border data flows, and who owns Canadian AI infrastructure — are federal in nature. The Regina project is the proximate trigger. The concern is national.

Specific federal tools include amending the Canadian Environmental Protection Act to regulate data centre environmental impacts, withdrawing federal funding for data centre projects, and levying a tax on data centres.

The NDP draws a clear line between small-scale, publicly useful machine learning — like medical research — and the multi-billion-dollar corporate AI industry built on generative AI, mass data extraction, and the displacement of millions of workers.

Who benefits? Who pays?

The $1.7 billion investment benefits Bell Canada, CoreWeave, and Cerebras. The energy costs, infrastructure burden, emissions, and governance fallout stay with Saskatchewan families and communities.

Bell already charges Canadians some of the highest phone and internet rates in the developed world. Now the same company wants the publicly-built SaskPower grid and a new publicly-funded SaskEnergy gas pipeline to sell cheap compute to American AI firms. SaskPower, SaskEnergy, and SaskTel were built by CCF and NDP governments as public goods — Saskatchewan invented the Crown corporation on the principle that energy, telecommunications, and other essentials must serve people first. That tradition is exactly what this project asks us to trade away.

This petition asks the federal government to use every lever it has to ensure data centre development serves the public interest — not corporate shareholders.

Regina–Wascana NDP | April 2026

Who Are CoreWeave and Cerebras?

CIA Money. MAGA Investors. Our Grid, Our Choice.

Regina–Wascana NDP
Background on the anchor tenants of Bell's proposed AI data centre in the RM of Sherwood.

Bell Canada is building the facility. But the companies that will actually occupy it — the reason it exists — are **CoreWeave** and **Cerebras**, both American.

CoreWeave: From Crypto Mining to AI Servers

CoreWeave was founded in 2017 as **Atlantic Crypto** by Michael Intrator, Brian Venturo, and Brannin McBee — three hedge fund traders who ran an Ethereum cryptocurrency mining operation. When the crypto market shifted, they pivoted the same GPU hardware to renting AI server capacity. The company rebranded to CoreWeave in 2019.

Financial profile: CoreWeave went public on the NASDAQ in March 2025. The IPO was troubled — they had to reduce both the offering price and size. The company is deeply unprofitable, carrying roughly **$7.5 billion in debt**, much of it collateralized against their Nvidia GPU contracts. A single customer — Microsoft — reportedly accounted for more than 60% of their revenue at the time of the IPO. If AI demand softens, the debt structure becomes precarious.

Major investors: The company's $7.5 billion debt facility was co-led by **Blackstone** and **Magnetar Capital** — the hedge fund that became infamous for profiting from the 2008 financial crisis by betting against mortgage-backed securities it helped create. Other investors include Coatue Management, Jane Street, and Nvidia itself (which is both their supplier and an investor — a vertical entanglement that raises competition questions).

Workforce: Roughly 1,000–1,500 employees manage billions in infrastructure. This is a capital-intensive model that creates very few local jobs — consistent with the 80 permanent positions Bell is projecting for the Saskatchewan facility.

Acceptable use: CoreWeave has **no published policy** excluding surveillance, facial recognition, predictive policing, or military AI applications from its platform. Their business model is infrastructure-agnostic — they rent GPU capacity to any paying customer.

US law exposure: As a US-incorporated company, CoreWeave is subject to the **CLOUD Act**, which allows American law enforcement and intelligence agencies to compel access to data stored on their servers — regardless of where those servers are physically located. Data stored on CoreWeave infrastructure in Saskatchewan could be accessed by US authorities without Canadian judicial oversight.

Cerebras: AI Chips for the Pentagon

Cerebras Systems builds wafer-scale AI processors — massive chips designed to train and run AI models. Their hardware is among the most powerful AI processors in the world. But the question isn't what the chips can do. It's who they're for.

US military contracts: Cerebras has **active, multi-phase contracts with DARPA** — the US Department of Defense's advanced research agency. It is currently in Phase 3 of the **Digital RF Battlespace Emulator** program, building real-time battlefield simulation and electronic warfare systems for the **US Navy**. In April 2025, DARPA selected Cerebras for an additional contract to deliver a "next generation, real-time compute platform for advanced military and commercial applications," with capabilities including real-time AI processing from military sensors and battlefield robotics.

CIA funding: Cerebras is a portfolio company of **In-Q-Tel** — the CIA's venture capital arm. In-Q-Tel describes Cerebras as "a cornerstone of In-Q-Tel's efforts to scale trustworthy, U.S.-based AI infrastructure for national security applications."

Trump-linked investor: In its $1.1-billion Series G funding round, Cerebras added **1789 Capital** as an investor. 1789 Capital is an anti-ESG venture fund co-founded by **Rebekah Mercer** — one of the largest donors to Donald Trump's political campaigns — with **Peter Thiel** instrumental in its creation. The fund explicitly aims to build an "America First" parallel economy.

UAE and Chinese military ties: Cerebras's largest customer, accounting for **87% of its revenue** in the first half of 2024, was **G42** — a UAE-based AI conglomerate. The US House Select Committee on China flagged G42's CEO for affiliations with "companies that develop dual-use technologies and materially support PRC military-civil fusion and human rights abuses." G42 had business ties to Huawei and BGI Genomics (a Chinese genomics firm placed on the US Entity List over surveillance concerns). Under pressure from the Committee on Foreign Investment in the United States (CFIUS), G42 was forced to divest from Chinese companies, and its Cerebras stake was restructured to non-voting shares.

Postponed and withdrawn IPO: Cerebras filed for a public offering in 2024 but **postponed and then withdrew it in October 2025** amid the CFIUS national-security review of G42's ownership stake. The company raised $1 billion privately and has refiled — targeting a 2026 listing, with G42 reportedly no longer listed as an investor.

Every data centre is US jurisdiction

Both CoreWeave and Cerebras are subject to the **US CLOUD Act**, which compels American companies to hand over data to US authorities regardless of where it is physically stored. Data on servers in Saskatchewan is legally accessible to US intelligence and law enforcement without Canadian judicial oversight.

This is not an abstract legal concern. In 2025, when the International Criminal Court's chief prosecutor issued an arrest warrant for Israeli Prime Minister Netanyahu, President Trump sanctioned the prosecutor and **Microsoft cut off his email access**. When the French Senate subsequently asked Microsoft France under oath whether it could deny US government requests for data stored within the European Union, the company admitted it **"cannot guarantee"** that.

As journalist Paris Marx has argued, every data centre operated by a US company functions as an extension of US jurisdiction — what European lawmakers now call a digital "kill switch." The Canada-United States-Mexico

Agreement compounds this: it contains clauses that **limit Canada's ability to regulate cross-border data flows** or to require companies to store Canadian data within our borders.

Building a 300 MW facility for US military-intelligence-linked AI companies on Canadian soil isn't just an energy question or a jobs question. It is a sovereignty question.

What this means for Saskatchewan

The $1.7-billion headline is Bell's number. But the facility is being built to serve these two companies — a debt-laden former cryptocurrency operation and a Pentagon AI contractor funded by the CIA and Trump-linked capital.

Saskatchewan is being asked to build a new natural gas pipeline, strain its electrical grid, and reshape public infrastructure for companies whose primary obligations are to American shareholders, American military agencies, and American law.

Eighty permanent jobs.

Regina–Wascana NDP | April 2026

Responding to Bell's "Bell AI Fabric" Page

CIA Money. MAGA Investors. Our Grid, Our Choice.

Regina–Wascana NDP
Treaty 4 territory | Responding to businessmarkets.bell.ca/regina-info, retrieved April 23, 2026.

About this document

Bell has launched a public-facing page branding the Regina project as **"Bell AI Fabric"** with the tagline *"Sovereign AI infrastructure — built by Canadians, for Canada."* The page presents a curated set of answers on water, noise, power, and community impact, and closes with a generic "What can AI do for Canada" marketing section.

This document takes Bell's page claim-by-claim and supplies the context it leaves out. For the full evidence base, see `fact-sheet.md`, `tenant-explainer.md`, and the source list in this module's `README.md`.

The framing: "Sovereign AI infrastructure — built by Canadians, for Canada"

This is the most important claim on the page, and the least supportable.

The 300 MW campus is being built to serve two anchor tenants — **CoreWeave** and **Cerebras** — both US-incorporated companies. Under the **US CLOUD Act**, American authorities can compel a US company to hand over data it controls, regardless of where that data is physically stored. Microsoft France told the French Senate under oath that it *"cannot guarantee"* it would refuse a US government data request for data sitting in European data centres. When President Trump sanctioned the International Criminal Court's chief prosecutor, Microsoft cut off his email. The legal regime running these servers is American — the steel and concrete sitting in Saskatchewan do not change that.

"Sovereign" is a marketing word. The tenancy, the regulatory exposure, and the ultimate control are not Canadian. See `fact-sheet.md` ("Canadian data in American hands") and `tenant-explainer.md` for the tenant backgrounder.

> ***At the door:*** *"Bell is the landlord. The tenants are American AI companies operating under US law. The jurisdiction running these servers is American — a Canadian address doesn't change that."*

Economic claims

"$12 billion in long-term economic value... including local employment and substantial municipal and provincial tax revenues."

The $12 billion figure includes the tenants' hardware — chips, servers, and networking gear manufactured elsewhere and leased to CoreWeave and Cerebras. It is not $12 billion landing in Saskatchewan paycheques or

Saskatchewan supply chains. The operating profit on leased AI compute flows to Bell and to the US tenants, not to provincial coffers. See `fact-sheet.md` ("Eighty permanent jobs").

"At least 800 construction jobs and 80 permanent operational roles... as many as 750 additional community jobs could result from a large data centre deployment of this nature."

Eighty permanent jobs for a 300 MW load on a provincial grid. The 750 "spin-off" figure is attributed to unspecified "industry research" — Bell does not name a study, a methodology, or a comparable facility. Comparable investment in energy-efficient buildings or renewable energy infrastructure generates 4 to 7 direct job-years of construction employment per million dollars — before multiplier effects — against an operational workforce of 80 staff for 300 MW of data centre load. See Bridge and Stanford, *Jobs for Today* (Centre for Civic Governance, 2025); `canvass-guide.md` ("Jobs").

"Bell AI Fabric will strengthen productivity and competitiveness in Saskatchewan and Canada across key sectors including agriculture, energy, financial services, and critical infrastructure."

The announced tenants — CoreWeave and Cerebras — rent AI compute to their own customers on commercial terms. No commitment, tenant roster, or pricing arrangement ties capacity to Saskatchewan agriculture, energy, or financial-services users. A Saskatchewan farmer would access this facility on the same terms as a farmer in Ontario or Arizona.

Water

Bell's page leads its environmental section with water, and on the narrow factual question it is mostly correct — the trade-off is what's missing.

"Sealed closed-loop cooling system paired with air-cooled heat rejection... No evaporative cooling towers. No routine cooling-water demand. No draw on municipal water sources or groundwater."

Accept the claim: this design does not consume water the way evaporatively-cooled data centres do. That's a real difference from a facility in Arizona or Virginia.

What the page does not say: air-cooled heat rejection requires significantly more *electricity* than evaporative cooling to move the same heat. On a grid that runs on roughly 80–90% fossil fuels, that extra electricity translates directly to extra emissions. Bell has chosen to minimize a water footprint on a grid where water isn't the binding constraint — and to push the cost onto the grid, where the binding constraint is carbon. See `fact-sheet.md` ("What about water?") and `canvass-guide.md` ("Bell says they're using a closed-loop cooling system").

"Technically, water is trucked in and added once during commissioning to fill the sealed system."

Also accept. Bell's page provides no numbers on cumulative trucked-in volume, or what happens when the system is drained, flushed, or topped up over its operating life. No independent environmental assessment exists.

Energy and the grid

This is the section with the most important omissions.

"Saskatchewan's grid, managed by SaskPower, includes a mix of natural gas, hydroelectric power and other sources."

Coal is missing from this sentence. Saskatchewan's grid is roughly 80–90% fossil fuels. At 630 g CO_2e per kilowatt-hour, its emission intensity is more than six times the national average of 100 g. Premier Scott Moe has committed to running coal until 2050 — two decades past the federal phase-out deadline. The province has said the data centre's baseload requirements help justify refurbishing aging coal plants. The "mix of natural gas, hydroelectric and other sources" phrasing is technically true only if "other sources" is doing an enormous amount of work. See `fact-sheet.md` ("A fossil-fuel anchor").

"SaskPower will supply the power on a dedicated industrial feed, separate from residential distribution."

"Dedicated industrial feed" describes the routing, not the billing. Grid investments, transmission upgrades, and capacity reserves run through SaskPower's entire ratepayer base — the data centre's costs land in the same shared ledger as everyone else's.

"Will electricity rates increase as a result of the additional load the Data Centre requires? No, rates are not going up as a result of the data centre being added to the grid."

This is the Virginia question. In Virginia — where data centres now cluster at industrial scale — regulators initially offered the same reassurance. They now project residential electricity bills could more than double by 2045 unless data centres pay their full share of grid costs. Dominion has already been granted rate increases. Virginia had to create a dedicated large-load rate class to try to shield households from further cost exposure — after the data centres were built, not before. The time to lock in household protection is before the load arrives, not after. See `fact-sheet.md` ("Energy costs for everyone") and `canvass-guide.md` ("Energy bills").

Omission: the SaskEnergy gas pipeline

Bell's page does not mention that **SaskEnergy is building a new high-pressure natural gas pipeline and meter station** specifically to serve on-site gas generation at this facility. A publicly-owned gas utility is constructing dedicated fossil-fuel infrastructure for this project. That is a material fact about the "responsible energy use" framing on the page. See `fact-sheet.md` ("A fossil-fuel anchor").

"Targeting a Power Usage Effectiveness (PUE) of 1.3."

PUE measures facility overhead — how much of the total electricity goes to the servers versus cooling, lighting, and other building load. A PUE of 1.3 is reasonable for a modern facility. PUE tracks efficiency overhead, not total draw. A 300 MW load at PUE 1.3 is still a 300 MW load on a fossil-fuel grid.

Community impact

"Low-noise equipment... landscaped berms and setbacks... dark-sky-compliant lighting... careful drainage planning... acoustic modelling to guide final design and mitigation."

Every commitment on the page is phrased as design intent, not binding obligation. **No independent environmental assessment exists**, and no enforceable performance standards have been set for noise, light, drainage, or air emissions once the facility is operating. A covenant tying noise levels to enforceable numbers — something a landowner could actually sue over — does not exist.

Bell also held a private meeting with concerned landowners who had been formally requesting information for months. Surrounding residents still have no enforceable recourse if the facility is non-compliant — nothing on record and nothing binding. See `canvass-guide.md` ("Community impact").

"Bell will fund project-specific infrastructure upgrades... not intended to shift costs onto local residents or the municipality."

"Project-specific" is narrower than "all costs." Bell is committing to roads and site access directly tied to construction. The long-run grid upgrades, gas pipeline costs, and emergency-response capacity that a 300 MW industrial facility pulls into the broader provincial ledger are outside that commitment.

What Bell's page does not mention

A useful way to read the page is by what it leaves out. Bell's own public-facing information does not reference:

- **The tenants.** No mention of CoreWeave or Cerebras. The page never names the companies the facility is being built to serve.
- **US data sovereignty.** No mention of the CLOUD Act, CUSMA data-flow constraints, or the US legal regime that reaches the tenants.
- **The gas pipeline.** No mention of the dedicated SaskEnergy high-pressure gas pipeline and meter station.
- **Coal.** The "energy sources" answer omits coal from Saskatchewan's grid mix.
- **Treaty 4 and the George Gordon First Nation MOU.** The project sits on land held by GGFN, which has signed a partnership with Bell. Bell's own PR page does not centre that partnership. The Regina–Wascana NDP respects GGFN's decision to participate (see `fact-sheet.md` and `canvass-guide.md`) — the observation here is that Bell itself is not foregrounding it.

A note on "What can AI do for Canada"

The page closes with a long marketing section on the benefits of AI: personalized healthcare, customized education, accelerated drug discovery, precision agriculture, and so on. None of this is tied to the Regina facility's actual tenants or their actual workloads. CoreWeave rents AI compute to third parties; Cerebras holds active DARPA contracts and CIA venture funding. Neither company has announced that capacity at this site will serve Saskatchewan hospitals, schools, or farms. This section of the page is generic AI-industry promotion, not a Regina-specific commitment.

Bottom line

At the door or at a table, the short version is:

> *"Bell's page is mostly about what this project isn't — it isn't using municipal water, the power feed isn't residential, the lights won't shine into your yard. Fine. The question is what it is: 300 megawatts of fossil-fuel-powered compute, leased to American AI companies under US law, built next to a Crown-owned gas pipeline SaskEnergy is building just to feed it. A pause gives us time to ask those questions before the concrete is poured."*

"CIA Money. MAGA Investors. Our Grid, Our Choice."

Regina–Wascana NDP | EDA social accounts

Use or adapt freely. Tag @NDP if you want — not required.

Short (Twitter / X — under 280 characters)

Option A — energy bills:
Bell is building a 300 MW AI data centre outside Regina to serve American companies. Virginia regulators warn residential bills could more than double by 2045 without strict cost protections. We're collecting signatures to demand a pause. Our energy should serve people first.

Option B — jobs:
$1.7 billion investment. 80 permanent jobs. Bell's AI data centre near Regina is being built for American AI companies — not for Saskatchewan workers. The NDP is calling for a pause. We're collecting signatures locally.

Option C — process:
A $1.7-billion project that reshapes Saskatchewan's grid is moving ahead without an independent environmental assessment and without meaningful public consultation. SaskEnergy is building a dedicated gas pipeline for it. We're petitioning for a federal pause until communities have a real say.

Option D — climate:
Saskatchewan's grid runs on 80% fossil fuels. A 300 MW AI data centre on that grid isn't green tech — it's a carbon anchor. The NDP leader has committed to pausing data centre expansion. We're collecting signatures in Regina–Wascana.

Option E — who are the tenants:
Bell's AI data centre near Regina is being built for CoreWeave — a former crypto mining company — and Cerebras, which has active DARPA military contracts and CIA venture funding. Rebekah Mercer's "America First" fund is an investor. This is who Saskatchewan is reshaping its grid for.

Medium (Facebook / Instagram — 100–200 words)

Option A — who benefits:

Bell Canada is building a $1.7-billion AI data centre campus on 160 acres just outside Regina. The anchor tenants? CoreWeave and Cerebras — both American AI companies.

Here's what Regina gets: 80 permanent jobs. A new natural gas pipeline. A 300 MW energy load on a grid that already runs on 80% fossil fuels. And no independent environmental assessment.

Here's what the American AI companies get: cheap Canadian energy and land for their servers.

NDP Leader Avi Lewis has committed to pausing data centre expansion until communities have been properly consulted and environmental impacts independently assessed. Our clean water and affordable energy should serve people first — not corporate AI.

We're collecting petition signatures in Regina–Wascana. Talk to a volunteer or message us to get involved.

Option B — the Virginia warning:

In northern Virginia, where data centres have clustered at industrial scale, regulators project residential electricity bills could more than double by 2045 unless data centres pay their share of grid costs. The state has already had to create a special rate class to try to shield households from further cost exposure.

Now Bell Canada wants to build a 300 MW AI data centre just outside Regina, on Saskatchewan's coal- and gas-heavy grid. SaskEnergy is already building a new high-pressure natural gas pipeline to feed the facility. Eighty permanent jobs. American AI tenants.

The NDP is calling for a federal pause on data centre expansion — to protect affordable energy, clean water, and community decision-making. We're collecting signatures locally.

Longer (Facebook page post — 300–400 words)

Title: "A $1.7-billion investment that leaves us holding the bill"

Bell Canada is building Canada's largest purpose-built AI data centre campus on 160 acres in the RM of Sherwood, just south of Regina. The investment: $1.7 billion. The tenants: CoreWeave and Cerebras — two American AI companies. The permanent jobs: 80.

Let's be honest about what this means for Saskatchewan.

Our electrical grid runs on roughly 80% fossil fuels — coal and natural gas. At 630 grams of CO_2e per kilowatt-hour, Saskatchewan has one of the dirtiest grids in Canada. A 300 MW data centre on this grid isn't a step toward clean energy. It's a carbon anchor that locks us into fossil fuel dependence for decades.

SaskEnergy is already building a new high-pressure natural gas pipeline specifically to serve the facility. In Virginia, where data centres have clustered at industrial scale, regulators warn residential bills could more than double by 2045 without strict cost protections — and the state has already created a dedicated rate class to try to shield households. Saskatchewan families and businesses will bear the cost of the infrastructure this facility demands.

The process hasn't inspired confidence either. No independent environmental assessment has been conducted. Bell has been slow to answer concerns from local landowners about noise, light, storm drainage, and disturbance to the surrounding area — and nothing about the impact is yet on the record or binding.

And then there's data sovereignty. CoreWeave and Cerebras are US-incorporated companies. Under the American CLOUD Act, US authorities can compel access to data held by American companies — regardless of where it's physically stored. We're building critical AI infrastructure on Canadian soil for companies that answer to American law.

NDP Leader Avi Lewis has committed to a Humans-First AI Policy that includes **pausing the expansion of AI data centres in Canada** — to protect clean water, preserve affordable energy for human health and wellbeing,

and give our democratic institutions time to catch up. The NDP supports useful applications of technology like medical research and clean energy management. What we're questioning is whether a 300 MW facility serving a former crypto mining company and a US military AI contractor should jump the queue ahead of community consent.

Bell already charges Canadians some of the highest phone and internet rates in the developed world. Now the same company wants our publicly-built SaskPower grid and a new publicly-funded SaskEnergy gas pipeline to sell cheap compute to American AI firms. SaskPower, SaskEnergy, and SaskTel were built by CCF and NDP governments as public goods — Saskatchewan invented the Crown corporation on the principle that some things must serve people first. And it's the same story across the economy: Loblaw posts record profits while families skip meals; Bell and Rogers charge some of the highest rates in the OECD; Cameco and Nutrien ship Saskatchewan's minerals to shareholders while communities absorb the cost. A public option — public grocery, real public telecom, public mineral royalties — is how working people claw back. A public grid that serves Saskatchewan families first, not American AI, is where we start.

We're collecting petition signatures in Regina–Wascana. If you think our energy, our water, and our democratic process should come first, add your name.

Message us or talk to a volunteer at your next local NDP event.

Email: Data Centre Petition Asset Package — To Members

From: Regina–Wascana NDP
To: EDA members / chapter leads
Subject: Pause Bell's 300 MW AI data centre — the petition drive

---

Hi [Name],

You may have seen the news: Bell Canada is building what it calls Canada's largest AI data centre campus — 300 megawatts on 160 acres in the RM of Sherwood, just south of Regina. The announced investment is $1.7 billion. The anchor tenants are CoreWeave and Cerebras — both American AI companies.

The land is held by George Gordon First Nation, which has signed a partnership with Bell on Indigenous procurement and workforce development. Our concerns — electricity rates, US tenants and the legal regime they operate under, the grid and pipeline build-out, and the absence of independent environmental review — apply regardless of that partnership. They're questions of federal policy on the data centre industry.

Here's what that means in plain terms.

Eighty permanent jobs. Not eight hundred — that's the temporary construction figure. The permanent workforce is 80 people. For context, a single medium-sized grocery store employs more people than that.

A massive new load on our grid. Saskatchewan's electricity comes from roughly 80% fossil fuels. SaskEnergy is already building a new high-pressure natural gas pipeline specifically to serve this facility. In Virginia, where data centres have clustered at industrial scale, regulators project residential bills could more than double by 2045 without strict cost protections — and the state has already created a special rate class to try to shield households. Every ratepayer in Saskatchewan is exposed to that risk.

No independent review. This project is advancing without an independent environmental assessment and without the kind of public process a $1.7B reshaping of the province's grid demands. Bell has been slow to respond to local concerns about noise, light, storm drainage, and disturbance to the surrounding area — and nothing about the impact is yet on the record or binding.

American tenants, Canadian soil. Under US law, American authorities can compel access to data held by US companies regardless of where it's stored. And these aren't neutral tech firms. CoreWeave started as a cryptocurrency mining company run by hedge fund traders. Cerebras has active DARPA military contracts building battlefield simulation systems for the US Navy, CIA venture funding, and an investor roster that includes Rebekah Mercer's "America First" fund. These are the companies we're reshaping Saskatchewan's grid for.

Public infrastructure, private profit. Bell already charges Canadians some of the highest phone and internet rates in the developed world. Now they want our publicly-built grid and a new publicly-funded gas pipeline to sell cheap compute to American AI firms. SaskPower, SaskEnergy, and SaskTel were built by CCF and NDP governments as public goods — a public grid, a public gas utility, public telecom. Saskatchewan invented the Crown corporation for exactly this reason: some things must serve people first. The question in front of us is whether that tradition still means something.

NDP Leader Avi Lewis has committed to a **Humans-First AI Policy** that includes **pausing data centre expansion** until communities have been properly consulted and environmental impacts independently assessed. Our clean water and affordable energy should serve people first.

What we're doing locally:

We're collecting petition signatures across Regina–Wascana calling on the federal government to pause data centre expansion until democratic oversight catches up. This is a community-rooted initiative — your riding association, your neighbours, your signatures.

How you can help:

- **Sign the petition** at your next local NDP event or contact us to arrange pickup of signature sheets.
- **Canvass your neighbourhood** — we have a canvasser guide with talking points, common objections, and instructions. No experience needed.
- **Share on social media** — we have ready-to-post copy for Twitter/X, Facebook, and Instagram. Just ask.
- **Talk to your neighbours** — the fact sheet is a good leave-behind for anyone who wants to learn more.

If you'd like canvassing materials, signature sheets, or social copy, reply to this email and we'll get you set up.

This is one of those issues where the numbers tell the story: $1.7 billion for Bell and two American AI companies. Eighty jobs and a gas pipeline for us. That's not a fair deal — and the petition is how we say so on the record.

It's also the same story playing out across the economy. Loblaw posts record profits while families skip meals. Bell and Rogers charge some of the highest rates in the OECD. Cameco and Nutrien ship Saskatchewan's minerals to shareholders while communities absorb the cost. A public option — public grocery, real public telecom, public mineral royalties — is how working people claw back. A public grid that serves Saskatchewan families first, not American AI, is where we start.

Thanks for everything you do,

[Name]
Regina–Wascana NDP

Treaty 4 territory | April 2026

Questions for Local First Nations Contacts

For the local EDA organizer
These are conversation-starters, not a checklist. The goal is to listen and learn, not to extract endorsements.

Context

The Bell AI data centre campus is being built on 160 acres in the RM of Sherwood — Treaty 4 territory. George Gordon First Nation has signed a procurement and workforce development partnership with Bell, but at least one band member has publicly raised concerns about inadequate prior consultation before that deal was announced.

These questions are for the organizer to bring to local First Nations contacts — elders, council members, community organizers, or anyone the organizer already has a relationship with. The purpose is to understand whether and how First Nations want to engage with this issue, not to assume they should.

Conversation-starters

On the development itself:

- Has your Nation or community been consulted about the Bell data centre project? If so, what did that process look like — and did it feel adequate?
- Are there concerns in your community about the data centre's impact on water, land, or energy in the region?
- Were there conditions or commitments made to your Nation as part of the development process? If so, are you comfortable sharing what those are?

On water and land:

- Are there water sources, waterways, or lands in the area of the RM of Sherwood development that hold particular significance for your Nation?
- Has anyone in your community raised concerns about the data centre's potential effects on local water quality or supply — even if Bell claims a closed-loop cooling system?
- Are there existing environmental monitoring processes that your Nation leads or participates in that could be relevant here?

On the partnership with Bell:

- George Gordon First Nation signed a partnership with Bell focused on procurement and workforce development. Does your Nation or community have a view on that agreement — positive, critical, or otherwise?
- Are there other Nations or communities in the Treaty 4 area that haven't been part of the conversation but should have been?

On the petition and NDP organizing:

- Would your Nation or community want to be named or referenced in petition materials about this issue? Or would you prefer not to be associated with party-political materials?
- Is there existing Indigenous-led opposition to or organizing around this data centre that we should know about — and if so, how can we support it rather than duplicate it?
- Is there a better way for the NDP riding association to be a good ally on this issue than a petition? Is there something else you'd want from us?

On what would actually help:

- If you could ask the federal government for one thing regarding this data centre, what would it be?
- Is there anything about how settler organizations typically approach these conversations that you'd want us to do differently?

Notes for the organizer

- **Don't bring all of these at once.** Pick the ones that feel right for the relationship and the context. A coffee conversation with two or three questions is more valuable than a formal questionnaire.
- **Listen more than you talk.** If someone wants to tell you their perspective at length, that's the most useful thing that can happen.
- **Don't promise anything.** You're here to learn, not to negotiate. If someone asks what the NDP can do, be honest about what's in your power and what isn't.
- **Report back what you're comfortable sharing.** Some of what you hear may be shared in confidence. Use your judgement about what to pass along and what to hold.
- **If someone says "no thanks"** — to the conversation, to being named, to the petition — respect that fully and don't push.

Regina–Wascana NDP | April 2026
